

Sometimes, when you think you have solved a problem, you realize that, in the end, you have created a bigger one. Or perhaps, you discover, in the end, that you only cured a symptom, and you didn't fix the root cause. The reason these things happen is that you are not thinking critically.

Critical thinking is both a mindset and, therefore, the application of some fundamental, simple tools. These critical thinking skills are invaluable.

The objectives of this lesson are the following:

- Understand the concept of critical thinking.
- Define the benefits of critical thinking.
- Distinguish between causes and consequences in the process of thinking critically.
- Explore breaking problems into small ones as a method to achieve better solutions.

To conclude...

Critical Thinking is a toolbox for thinking better and solve problems. Before rushing to solve a problem without thinking, it is better to take the time to analyze obstacles, causes, and consequences, etc. That will allow us to solve the problem and not only a symptom of that problem.

If we show, we sensitize ...
If we sensitize, we protect!
